PRISM INSURANCE

Policy & Claims Analysis Dashboard

PROJECT REPORT & BUSINESS RECOMMENDATIONS

Project focus	Insurance portfolio, premium, coverage and claim-status analysis
Primary tool	Microsoft Power BI Desktop
Dataset	InsuranceData.csv — 10,004 records and 13 fields
Project file	Prism Insurance.pbix
Report date	22 October 2026

Turning insurance data into clear, actionable business insights.

1. Executive Summary

This report analyses the supplied Prism Insurance Power BI project and its CSV dataset. The figures below are calculated from the CSV and describe the available records; they do not independently prove profitability, claim risk or operational causes.

■5,976,969.88	**■600,551,497.67**
Total premium amount	Total coverage amount
10,004	**5,649**
Dataset records	Records with claim amount above zero
■16,912,302.73	**4,355**
Total recorded claim amount	Missing ClaimDate values

Headline observations

• Travel is the largest policy category with 4,148 records (41.5% of the dataset).

• Claim statuses: 3,386 Settled, 2,263 Pending and 4,355 Rejected.

• ClaimDate is blank in 4,355 records (43.5%). Confirm the business rule for these blanks before filling or interpreting them.

• All other fields have no blank values in the supplied CSV; data types and date formats should still be validated.

2. Dataset & Tools

The dataset includes policy/customer identifiers, gender, age, policy type, policy dates, premium, coverage, claim identifier/date/amount and claim status. It contains 10,004 rows and 13 columns.

Field / metric	Observed result
Rows / columns	10,004 / 13
Age range	18–87 years (mean 52.3)
Gender distribution	Female 5,001; Male 5,003
Average premium	■597.46
Average coverage	■60,031.14
Average positive claim amount	■2,993.86
Missing values	ClaimDate: 4,355; other fields: 0

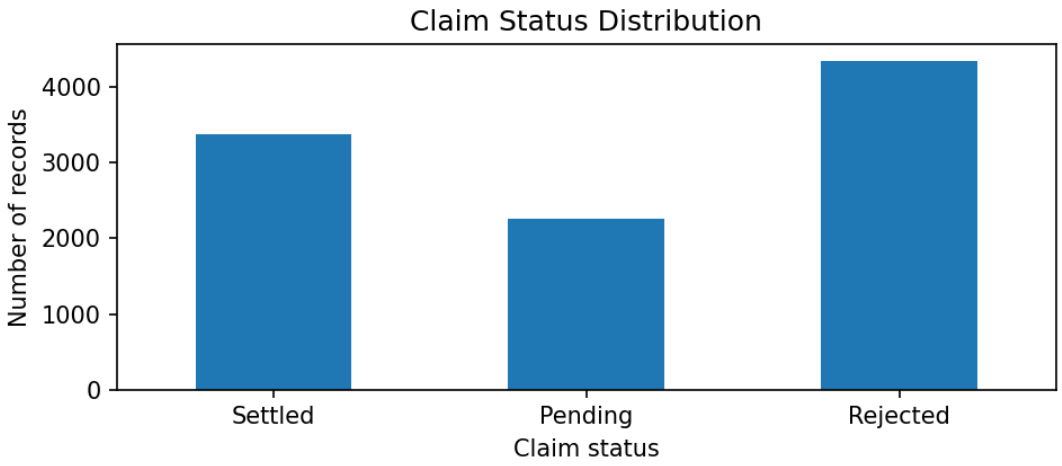

Tools and workflow

Primary tool: Microsoft Power BI Desktop using the supplied Prism Insurance.pbix file.

Data source: InsuranceData.csv. Summary statistics were calculated from the CSV for reconciliation.

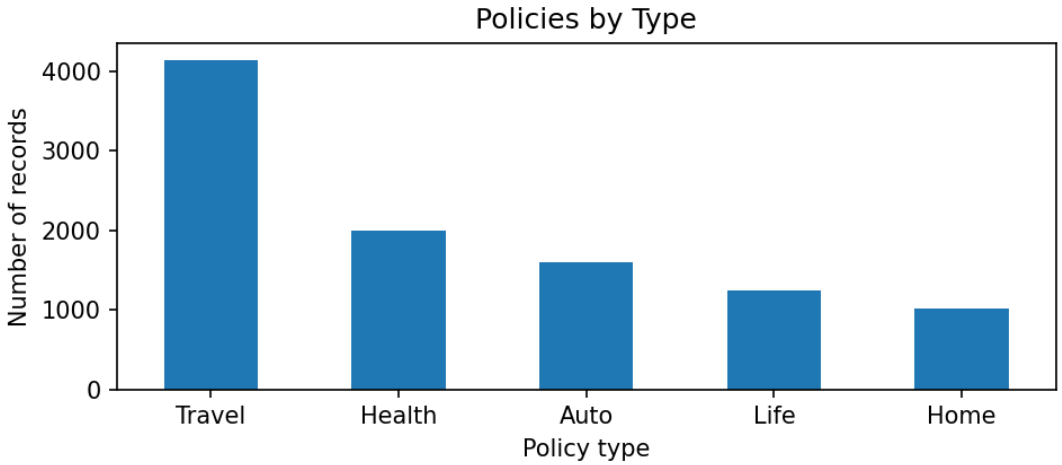

Recommended workflow: use Power Query to validate types and missing values; create documented DAX measures for totals and rates; use KPI cards, bar charts, status visuals and slicers for interactive analysis. These are recommendations and are not assertions that each item is already implemented in the PBIX.

Claim status distribution

3. Policy Portfolio Analysis

Travel is the largest category by record count. Compare aggregate totals with per-policy averages and rates because category sizes differ.

Policy type	Records	Premium total	Coverage total	Claim amount total
Travel	4,148	■2,478,329.99	■250,825,659.90	■7,096,869.34
Health	2,000	■1,199,727.04	■120,101,820.35	■3,432,319.02
Auto	1,595	■959,863.74	■94,466,885.52	■2,724,347.12
Life	1,248	■734,816.05	■74,103,544.12	■2,063,004.60
Home	1,013	■604,233.06	■61,053,587.78	■1,595,762.65

Interpretation: Travel represents the largest segment by volume (4,148 records), followed by Health (2,000). Travel is a useful starting point for reviewing claim frequency, settlement time and customer experience. High totals alone do not prove lower profitability; expenses, reserves and exposure duration are not available.

4. Claims Analysis

Claim status and claim amount should be interpreted using agreed business definitions. The available data does not explain why a claim was rejected or how long settlement took.

Claim status	Records	Share of rows	Recorded claim amount
Settled	3,386	33.8%	■10,105,060.19
Pending	2,263	22.6%	■6,807,242.54
Rejected	4,355	43.5%	■0.00

Key observations

• Settled records: 3,386 (33.8%).

• Pending records: 2,263. Confirm whether their amounts are requested, reserved or approved.

• Rejected records: 4,355. Confirm whether rejected claims should have a zero or blank ClaimAmount.

• 5,649 records have ClaimAmount above zero. Verify the uniqueness of PolicyNumber and ClaimNumber before treating row counts as policy or claim counts.

Recommended dashboard visuals

Visual	Purpose
KPI cards	Total premium, coverage, claim amount, policy count and pending claims
Bar chart	Compare policy types by record count, premium and claim amount
Status chart	Show claim-status distribution with clear counts and labels
Age-band chart	Compare policy and claim metrics across meaningful age groups
Slicers	Policy type, gender, claim status and policy start year
Detail table	Policy number, policy type, claim status, amount and date for drill-through

5. Recommendations & Action Plan

These are proposed actions based on the observed data and available fields. They should be validated with the data owner before being used for operational decisions.

Priority	Recommendation	Reason / next step
High	Validate blank ClaimDate values	4,355 dates are blank. Confirm whether this is expected; do not automatically fill unknown dates.
High	Define claim-status rules	Document Pending, Settled and Rejected, including how ClaimAmount should be recorded for each status.
High	Check identifiers and row grain	Test uniqueness of PolicyNumber, CustomerID and ClaimNumber. Establish whether each row represents a policy, customer or claim.
High	Add valid claim rates	After validating the row grain, calculate claim frequency, settlement rate and pending share with explicit denominators.
Medium	Review Travel segment	It has the highest record volume. Review claim frequency, average claim amount and pending ageing.
Medium	Add time trends	Parse date columns into proper date types and report monthly/quarterly trends where dates are reliable.
Medium	Add quality checks	Flag negative amounts, end dates before start dates, implausible ages and duplicate identifiers.
Medium	Improve dashboard usability	Add slicers, clear titles, currency formats, tooltips and drill-through detail.
Low	Document refresh steps	Record the CSV source location, refresh steps and validation checklist.

Suggested KPI definitions

KPI	Suggested definition (after validation)
Total Premium	Sum PremiumAmount at the correct policy grain
Total Coverage	Sum CoverageAmount at the correct policy grain
Claim Count	Distinct valid ClaimNumber count, if ClaimNumber is a claim identifier
Settlement Rate	Settled claims divided by resolved claims; define the denominator explicitly
Pending Share	Pending claims divided by all valid claims
Average Claim Amount	Average ClaimAmount for a defined group, such as settled claims only

6. Limitations & Next Steps

Limitations

• This is one CSV extract without a documented business glossary or source-system specification.

• The intended row grain and uniqueness of identifiers need confirmation before row counts are treated as policy or claim counts.

• Premium and coverage totals may need deduplication if policies or customers appear more than once.

• Expense, commission, reserve, underwriting and customer-satisfaction data are not included, so profitability or causation cannot be established.

Next steps

1. Confirm identifier meanings and claim-status rules with the data owner.

2. Validate data types and quality in Power Query; preserve dates that are genuinely unknown.

3. Create documented measures and reconcile Power BI values against the CSV.

4. Review the results with an insurance domain stakeholder before making decisions.

Overall conclusion

The Prism Insurance dashboard is a useful starting point for understanding policy mix and claim status. Validating missing claim dates, status rules and identifier grain is the most important next step before building reliable claim rates and time trends.

THANK YOU!

Thank you for reviewing the Prism Insurance Policy & Claims Analysis Dashboard report.

Questions • Feedback • Discussion

Prepared using the supplied InsuranceData.csv and Prism Insurance.pbix files.
